Exercise E1 Electrostatics I

(written test, approx. 10 % of a 120-minute written test, SS2022)

2. What will be the magnitude of the electric force on the charge q_4 ? The values of the point charges are $q_1 = 4 \text{ nC}$, $q_2 = 1 \text{ nC}$, $q_3 = 1 \text{ nC}$, and $q_4 = 4 \text{ nC}$. Which value needs E_4 to have to get a resulting force of 0 N on q_4 ?

Path: $q_0 = -1 \sim \text{rm nC\$}$

- $q_1 = -2 \text{ nC}$

$$\text{path}\$Es4.4310.97\text{--}\text{r}\text{f}\text{f}\backslash\text{rm}\text{m}\backslash\text{C}\text{over}\{\backslash\text{rm m}\}\}\$$$

- $\vec{F}_{01} = \left(\begin{array}{ccc} 19.97 & \sim \mu N & 0 \end{array} \right)$

With the `left` and `right` components we can calculate the resulting magnitude of the

The perpendicularity condition can be expressed as

$$\frac{\partial}{\partial \theta} \left(\frac{V_m}{V_s} \right) = 0 \quad (1)$$

$$\|\vec{F}\| = \sqrt{\left(\sum_i F_{i,x}\right)^2 + \left(\sum_i F_{i,y}\right)^2}$$

In the flow of 0.3 l/s (left) the head is 1.05 m, $Q = 0.05$ m³/s, $N = 20$, 10 10.05

Here, this finding has to be done for the first time. The results of the study are as follows:

$$\{01\} \mid \&= |E| \cdot |q| \mid \rightarrow E \&=$$

$$\{\{\{19.97 \cdot 10^{-6}\} \sim \rm M$$

$$\frac{\|\vec{F}_1\|}{\|\vec{d}_0\|} \approx \frac{19.9}{10^{-6}} \approx 2 \times 10^7 \quad \text{and} \quad \frac{\|\vec{F}_2\|}{\|\vec{d}_0\|} \approx \frac{10.07}{10^{-6}} \approx 10^7$$

$$\left(\cdot 10^{-9} \right) \sim \left(\text{m C} \right) \} \} \&= 19.9 / \dots \left(\cdot 10^3 \right) \{ \{ \left(\text{m N} \right) \over \left(\text{m C} \right) \} \} \&=$$

$$19.97... \cdot 10^3 \left\{ \frac{\text{VAs/m}}{\text{As}} \right\} \parallel \&= 19.97... \cdot 10^3 \left\{ \text{VAs/m} \right\}$$

$$V_{\overline{\rm m}} \quad \quad \quad$$

1. Calculate the single forces $\vec{F}_{01}$, $\vec{F}_{02}$, $\vec{F}_{03}$, on the charge q_0 !

Path

First, calculate the magnitude of the forces, like $|\vec{F}_1|$.

The force $\vec{F}$ is purely on the x -axis and therefore equal to

$$\vec{F} \{01,x\} = F \{01,x\}$$

$$\frac{\{1\}}{4\pi\epsilon}\cdot\{q_1\cdot q_0\}^{r^2\{0\}} \quad \&=$$

$$\left\{ \frac{1}{4\pi} \right\} \cdot 8.854 \cdot 10^{-12} \sim \frac{\text{As}}{\text{Vm}} \cdot \left\{ \frac{1}{4\pi} \right\} \cdot 10^{-9}$$

$$\sim \mathrm{C} \cdot 2 \cdot 10^{-9} \sim \mathrm{C} \cdot \frac{3 \cdot 10^{-2}}{\mathrm{m}^2} \sim \mathrm{m}^2 \text{ } \& \equiv$$

$$\frac{\rho_{\text{H}_2\text{O}} \cdot V_{\text{H}_2\text{O}}}{\rho_{\text{H}_2\text{O}} \cdot V_{\text{H}_2\text{O}} + \rho_{\text{H}_2\text{O}} \cdot V_{\text{H}_2\text{O}}} = \frac{\rho_{\text{H}_2\text{O}} \cdot V_{\text{H}_2\text{O}}}{\rho_{\text{H}_2\text{O}} \cdot V_{\text{H}_2\text{O}} + \rho_{\text{H}_2\text{O}} \cdot V_{\text{H}_2\text{O}}} = 19.97\% \cdot 10^{-6}$$

$\cdot 10^{-6} \text{ \rm \{VAs\}\over{m}} = 19.97... \cdot 10^{-6} \text{ \rm \{Ws\}\over{m}} \quad \&= 19.97... \text{ \rm \mu N} \quad \text{\text{(to the right)}}$

Similarly, we get for $\vec{F}_{02}$ and $\vec{F}_{03}$

$$\vec{F}_{02} = F_{02,x} \quad \&= -28.09... \text{ \rm \mu N} \quad \text{\text{(to the right)}}$$

$$\vec{F}_{03} \quad \&= -22.47... \text{ \rm \mu N} \quad \text{\text{(to the top left)}}$$

For $\vec{F}_{03}$, we have to calculate the x - and y -component.

This is possible, by using the angle α between the line through q_0 and q_3 and the positive x -axis (pointing to the right).

So, α has to be between 90° and 180° . It can be calculated by:

$$\alpha = \arctan\left(\frac{-4 \text{ cm}}{+2 \text{ cm}}\right) = \pi - 1.1071... = 180^\circ - 63.4...^\circ = 116.6...^\circ$$

Based on this, the x - and y -component is:

$$F_{03,x} \quad \&= |\vec{F}_{03}| \cdot \cos \alpha = 10.05... \text{ \rm \mu N} \quad \text{\text{(to the left)}}$$

$$F_{03,y} \quad \&= |\vec{F}_{03}| \cdot \sin \alpha = 20.10... \text{ \rm \mu N} \quad \text{\text{(to the top)}}$$
