conversions, battery, chapter1 1

Exercise E4 Conversions: Battery

2. How many minutes could a constant battery with 10 kWh be supplied by provided the given power for thermal time?

Rektion

$t = 200'000 \sim \{\text{min}\}$

There are additional losses:

$W = 10 \sim \{\text{kWh}\} = 10'000 \sim \{\text{Wh}\}$
 $t = \frac{W}{P} = \frac{10'000 \sim \{\text{Wh}\}}{50 \sim \{\text{W}\}} = 200'000 \sim \{\text{min}\} = 199 \sim \{\text{days}\}$

- The battery has an internal resistance. Depending on the current the battery provides, this leads to internal losses.
- The internal resistance of the battery depends on the state of charge (SoC) of the battery.
- The wires also add additional losses to the system.
