Exercise E1 Coil in a magnetic Field
(written test, approx. 4 % of a 120-minute written test, SS2021)

A coil with a number of turns $n = 300$ and a cross-sectional area $A = 600 \text{ cm}^2$ is located in a homogeneous magnetic field.

The rotation of the coil causes a sinusoidal change in the magnetic field in the coil with the frequency $f = 80 \text{ Hz}$.

The maximum value of the magnetic flux density in the coil is $\hat{B} = 2 \cdot 10^{-6} \text{ Vs/cm}^2$.

Derive the formula for the voltage induced in the coil and calculate the voltage amplitude.

Path

The induced voltage is given by:

$$\begin{aligned} U_{\text{ind}} &= - \frac{d\Psi}{dt} \quad \&= - n \frac{d\Phi}{dt} \end{aligned}$$
